DETAILED ACTION

1. Claims 1-30 have been presented for examination based on applicant's amendment filed 19 December 2005. The examiner maintains the rejection of claims 1-7, 10-17, 20-27, and 30. Claims 8, 9, 18, 19, 28, and 29 remain objected to.

Response to Arguments

2. Applicants have argued that Pederson should be disqualified as prior art as evidenced by the provided assignment document that indicates common assignment to NCR corporation. The examiner withdraws the 103(a) rejection in view of Pederson, but notes that the assignment document appears to be signed on 23 January 2003, after the filing of applicant's present application. Clarification is requested.

Applicant's arguments with respect to claims 1-7, 10-17, 20-27, and 30 have been considered but are moot in view of the new ground(s) of rejection. Please see new grounds for 103(a) rejection below.

Preamble of the Claims

3. The preambles of independent claims 1, 11, and 21 as presented for examination, have not been given patentable weight. Appropriate weight is given to limitations recited in the body of the claim that are needed for purpose of antecedence. "A mere statement of purpose or intended use in the preamble of a claim need not be considered in finding anticipation; however, it must be considered if the language of a

Art Unit: 2128

preamble is necessary to give meaning to the claim" Diversitech Corp. v. Century Steps, Inc., 7 USPQ2d 1315 (Fed. Cir. 1988); In re Stencel, 4 USPQ2d 1071 (Fed. Cir. 1987)

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Application/Control Number: 10/020,723 Page 4

Art Unit: 2128

4. Claims 1-7, 10-17, 20-27, and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Application 2003/0037185 issued to Davis in view of U.S. Patent 6,934,755 issued to Saulpaugh et al.

Independent claims 1, 11, and 21 are drawn to:

Method, system, and computer code for executing database transactions by:

- defining interconnected nodes in terms of processor/storage resources of parallel computing system;
- mapping first virtual processors to subset of nodes to create map with virtual processor mapped to each node in first subset
- mapping second virtual processors to subset of nodes to create map with virtual processor mapped to each node in second subset
- storing first/second map as configuration
 - executing transaction using first set of virtual processors and simultaneously executing transaction using the second set of virtual processors.

Regarding independent claims 1, 11, and 21: Davis discloses defining interconnecting nodes (abstract, para: 008, 0023, Figs. 3, 5, 6) in terms of storage resources (para: 005-008, Figs. 1, 6A, 6B) in parallel processing (multiprocessor) computing system inclusive of mapping virtual resources as node sets (para: 0008). Davis further discloses that the processor resources are mapped to first and second (para: 0011, 0012, 0026, Fig. 3) node group mappings (i.e. the mapping groups are functionally equivalent to "sets" and "subsets" by including replacement nodes, para: 0029) inclusive of the system and I/O resource requirements (i.e. configuration, para: 0024).

Art Unit: 2128

Davis does not explicitly disclose interconnecting nodes that represent virtual processors executing transactions.

Saulpaugh teaches defining interconnecting nodes that represent virtual processors (machine) in a parallel computing system (CL13-L29-37) inclusive of executing transactions (Abstract, Fig. 6) based on groups (CL4-L11-29) relating data storage (database) facilities (resources) in a distributed parallel processing system.

Saulpaugh further discloses the simultaneous execution (CL23-L45 to CL24-L40) of the related transactions over the parallel system.

It would have been obvious to one having ordinary skill in the art at the time the claimed invention was made to modify the teachings of Davis relating to defining interconnecting nodes and mapping of virtual resources in a parallel processing system, with the teachings of Saulpaugh relating to virtual processors executing transactions, to realize the elements of the claimed invention. An obvious motivation exists since, in this case, the Davis reference teaches to the Saulpaugh reference, and the Saulpaugh reference teaches to the Davis reference. Specifically, both Davis and Saulpaugh teach defining interconnected nodes in parallel processing systems and both are used in the same technological arena as noted above. Davis teaches to Saulpaugh because Davis teaches defining interconnecting nodes that includes mapping of virtual processing resources. Saulpaugh teaches to Davis because Saulpaugh specifically teaches defining the interconnecting nodes of virtual processors executing transactions. (See: Saulpaugh: para: 0055) Further, the level of skill required by an artisan to realize the claimed limitations of the present invention is clearly established by both references.

(See: Davis/Saulpaugh, Abstract) Accordingly, a skilled artisan tasked with realizing a system and method for executing database transactions by defining interconnected node and mapping sets of virtual processors, and having access to the teachings of Davis and Saulpaugh, would have knowingly modified the teachings of Davis with the teachings of Saulpaugh (or visa versa) to realize the claimed elements of the present invention while reducing the cost and development time.

Per dependent claims 2, 4, 12, 14, 22, and 24: These claims include additional limitations relating to exception based on failed and restored nodes and are rendered obvious in view of the teachings of the substitute node (restored) and handicapped node (failed) disclosed by Davis (para: 0029).

Per dependent claims 3, 5, 6, 13, 15, 16, 23, 25, and 26: These claims include additional limitations relating to a third mapping, halting transactions, and use of virtual processors that are mapped to failed nodes. These limitations are therefore rendered obvious by Davis, since Davis discloses a third and forth mapping of the resources (para: 0031-0034, Figs. 5-6B) and modifying the resource map in response to failed components (para: 0031-0034, Figs. 5-6B). Saulpaugh teaches terminating the transaction task (CL23-L45 to CL24-L40) and would have knowingly been incorporated by a skilled artisan using the same reasoning as previously cited above.

Per dependent claims 7, 17, and 27: As noted above, Saulpaugh teaches executing a database transaction. Obviously a skilled artisan would have known to use a configuration table in associating the execution of transactions as a method of storing

a list of records (i.e. configuration data) in a relational database. (See: "table", Microsoft Computer Dictionary, 1997)

Page 7

Per dependent claims 10, 20, and 30: As also previously cited above, Saulpaugh teaches discloses the simultaneous execution (CL23-L45 to CL24-L40) of the related transactions over the parallel system and hence would have knowingly been incorporated by a skilled artisan using the reasoning cited above.

Allowable Subject Matter

5. Claims 8, 9, 18, 19, 28, and 29 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. In this case the prior art of record does not disclose the specific sequences of steps relating to executing a transaction by identifying tasks and storage resources for completing transactions, defining groups of virtual processors and transaction groups having access to storage resources, assigning tasks and groups including virtual processors having access, and completing the tasks via virtual processors assigned to the transaction group as specifically recited in dependent claims 8, 18, and 28.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
